

Cadence

A wearable that catches a Parkinson's gait freeze and shows it the instant it happens — on the body, on screen.

ONE SENSOR. THREE JOBS.

MONITOR

Tracks walking activity and movement energy continuously from one ankle accelerometer.

DETECT

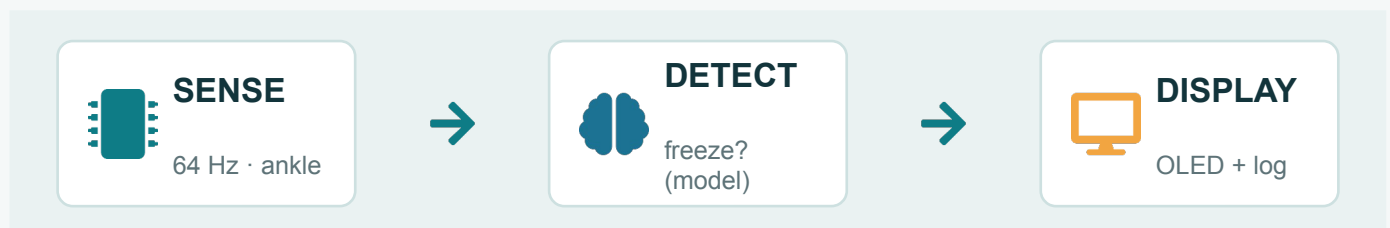

Spots freezing of gait with a model trained and validated on real patient recordings.

DISPLAY

Shows the live freeze state on an on-body OLED and logs every episode for the clinic.

HOW IT WORKS — FROM ANKLE TO SCREEN

Each freeze shows on-screen the instant it is detected, and is logged for review — one sensor in, one clear answer out.

≈50%

of people with Parkinson's experience freezing of gait*

64 Hz

single ankle accelerometer

~2 s

freeze re-checked, shown on the body

*Estimates vary with disease stage and assessment; commonly cited around 50%.

In good company. Builds on ideas demonstrated by Apple Watch's Movement Disorder API, PDMonitor and STAT-ON — clinical-grade Parkinson's monitors — in one low-cost wearable.

Validated on real patient recordings (Daphnet) using leave-one-subject-out testing.
